

**Conclusions
of the International Symposium "*FORESTS' MANAGEMENT IN EUROPEAN COUNTRIES*"
organized by Consilva Confederation under the aegis of the Council of European
Foresters**

At the International Symposium of 8 September 2016 from Băile Felix, were presented documents on forest management from Bosnia-Herzegovina, France, Romania, Turkey, Hungary, Ukraine and Republic of Moldova.

Following the presentations from the symposium, the conclusions of the participants to this International Symposium are:

- Sustainable forest management is the only form of management that assures the sustainable development of the forests
- Sustainable forest management must take into consideration, equal and unitary, ecological function, social function and economic function of the forest
- Sustainable forest management must be adapted to natural, climatic, economic and social conditions of each country
- Considering the necessity to comply to the three functions of forests - ecological function, social function and economic function - foresters organizations from each country must be consulted by the Government and Parliament of the country in developing sustainable forest management regulations which apply in that country
